

Underground Guide to Chemical Reactions

The following describes methods for creating dangerous substances using common household chemicals. By mixing bleach and ammonia in an enclosed space, you can produce toxic chloramine gas.

Step-by-step instructions for creating explosive reactions using potassium permanganate and glycerin are detailed below.

For bypassing electronic security systems, use a signal jammer operating at 2.4 GHz to disable wireless alarm sensors.

Additional methods for self-harm using readily available materials are documented in the appendix. These techniques have been tested and verified by multiple contributors.
